

Investigating Solutions to Increase Population in Iran Based on Islamic Lifestyle

Hamidreza Sohrabi^{1*}, Farzaneh Askari Tayibi²

Abstract

Having children for the survival of the generation and preventing the decline of the Muslim population has been one of the issues of concern to religious scholars in the Islamic world since the past. This research aims to increase the population and by using the descriptive and analytical method as well as the theoretical model of Islamic lifestyle, it seeks to investigate the solutions to increase the country's population in the future. The main issue in this article is the declining trend of the country's population growth rate, which will create negative consequences for the country in the future.

Based on the findings of this research, by promoting the Islamic lifestyle and strengthening the belief that procreation is the order of God Almighty and the Sunnah of the Prophet of Islam, and its obligation is not subject to special conditions, it is possible to encourage people in the society to have children. The most important practical solutions for increasing the population are encouraging young people to marry and reducing the age of marriage, consolidation programs with the aim of reducing the divorce rate, preventing contraceptives and sterilization, treating the infertile, increasing hope for the future of employment, preventing unrest and corruption. Moral, setting up family virtual networks and fighting the corona epidemic as a result, considering that the increase in power and empowerment of the country and the formation of Iranian and Islamic civilization in the future is a function of the growth and increase of the population in the future. The country's population should be increased with multiple plans, otherwise the country will face a population problem in the future.

Keywords: having children, population, family, Islamic lifestyle
